

# Preliminary Soil Study for Septic System Suitability

May, 2026

John R. Davis, Jr. LSS

Parcel 037503 Bert Winston Road

The two "Orange" shaded areas have **Suitable** and usable soil for septic systems. They are usable for gravel or gravelless septic trenches. An office with 10 employees will generate 250 gallons per day. The total area required for a septic system and repair or replacement area is about 5,000 square feet. Each of the two usable soil areas have adequate soil for an office septic system. A proposed building, drive and parking may be located on this property so that at least 5,000 sf of usable soil remains for a septic system. The low area with the stormwater drain may require filling and routing of the stormwater so the site can be developed.
