

The "Orange" shaded soil area shown above contains approximately 20,000 square feet and in my opinion is **usable** for shallow conventional, modified or alternative septic systems. This soil is a sandy loam over a clayey material more than 30 inches deep. A four of five bedroom house generally requires 10,000 square feet of usable soil for a septic system, so this area has twice the amount of soil required for a septic field. The soil borings are flagged in the field with blue flagging tape. This soil map does not mean there are not other usable soil areas on this property. This determination is subject to concurrence and approval by Warren County Health Department.
